Series wiring increases the sum output voltage of a solar panel array but keeps amperage the same. Parallel wiring increases the sum output amperage of a solar panel array while maintaining the same voltage. The choice you make can have a significant impact on your system's overall performance.

**Wiring Solar Panels in Parallel.** In parallel wiring, you wire all negative poles of all panels to the same line. Respectively, all positive poles to another line. Then, you connect each line to the respective connectors of the inverter. In a parallel connection, the voltage remains equal to the voltage of the lowest voltage panel.

To wire solar panels in parallel, you need to buy the appropriate branch connectors for the number of panels you're wiring in parallel. (You may also need to buy inline MC4 fuses and connect them to the positive cable of each solar panel.) I'll show you how to wire 2 panels in parallel using Y branch connectors.
