Can a smart microgrid be developed in a university campus?

The design and development of such a smart microgrid in a university campus is proposed within the 3DMicroGrid project (funded through the ERANETMED European Union's initiative). This paper reviews the main components and characteristics of similar microgrids developed around the world.

Why is campus microgrid design important?

Although campus microgrid design is not a mainstream topic, it also has research value (Alrashed, 2020, Huang, Gamil, et al., 2020, Huang, Masrur, et al., 2021, Husein and Chung, 2018, Talei et al., 2015), which is an indispensable part of realizing sustainable cities and society.

What are institutional microgrids?

A load of institutions is commercial, and these institutional microgrids are considered more important due to the research and development facilities available in an institution. These types of microgrids are also called campus microgrids.

What is a microgrid and how does it work?

A microgrid is a small-scale electrical system which consists of several loads and sources (conventional and renewables) that can either operate autonomously in a stand-alone mode or interconnected with the main grid.

Can a microgrid be used in other micro grids?

Firstly, the study only focuses on one campus microgrid, and the findings may not directly apply to other microgrids with different characteristics.

Can EV charging load prediction improve energy security in campus microgrids?

In order to improve the efficiency and stability of renewable energy sources and energy security in microgrids, this paper proposes an optimal campus microgrid design that includes EV charging load prediction and a constant power support strategy from the main grid.

This paper presents the method we followed to design a microgrid at a university campus based on available resources. Due to introduction of renewable resources to produce energy, a methodology that allows design a microgrid in a university campus is very useful. Hence, we present a series of steps that must be carried out to estimate the resource to be ...

Abstract: Microgrids have been proposed as a solution to the growing deterioration of traditional electrical power systems and the energy transition towards renewable sources. One of the most important aspects of the efficient operation of a microgrid is its topology, that is, how the components are connected.

In Section 3 the campus microgrid is fully described and the experimental setup for the identification process is presented. In Section 4, experimental identification is performed and the identified dynamics are described for the campus microgrid when the three inputs, reactive power, solar irradiance and power demand, are considered.
