Should energy storage be co-optimized?

Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible. Goals that aim for zero emissions are more complex and expensive than net-zero goals that use negative emissions technologies to achieve a reduction of 100%.

How can energy storage be used to save energy?

Utilizing compressed air to store excess energy in underground caverns or tanks. Electrolysis of water to produce hydrogen for storage and later conversion back to electricity. Need for continued research and development to drive down costs b. Efficiency: Ensuring energy storage solutions can be scaled up to meet increasing demand.

In addition to these well-established technologies, there are a few new energy storage developments that have a lot of potential.
