What is the cooling performance of a PCM-based cold thermal energy storage box?

Melting points of the PCMs varies the box cooling time from 2.1 to 9.6 h. The vacuum insulated panel can prolong the cooling time of the box to 46.5 h. What is discharging depth in thermal energy storage based cold box?

The discharging depth is defined as the ratio of energy released for cooling the interior to the energy stored in the device, can be used as an indicator for the optimization of the thermal energy storage based cold box. In this work, the liquid fraction of the PCMs inside the cold plates is used to represent the discharging depth.

Passive cool boxes work just like cool bags. They use the box's material to provide insulation and need ice or ice packs to keep them cool. Electric cool boxes don't require ice but need to be plugged in to keep cool. A 12V car plug is the most common type of charger, but several come with a UK mains plug or adaptor.
