

What is the photovoltaic effect?

The photovoltaic effect is a process that generates voltage or electric current in a photovoltaic cell when it is exposed to sunlight. It is this effect that makes solar panels useful, as it is how the cells within the panel convert sunlight to electrical energy. The photovoltaic effect was first discovered in 1839 by Edmond Becquerel.

How do you know if a solar panel is octagonal?

If you have solar panels installed nearby, go there and look closely at them. You will notice each panel consists of several small rectangular or octagonal units. These units are nothing but solar cells. A solar panel consists of numerous solar cells. Solar cells are the engine of the photovoltaic system.

Where does the photovoltaic effect occur?

The photovoltaic effect occurs in solar cells. These solar cells are composed of two different types of semiconductors - a p-type and an n-type - that are joined together to create a p-n junction. To read the background on what these semiconductors are and what the junction is, [click here](#).

Who discovered the photovoltaic effect?

The photovoltaic effect was first discovered in 1839 by Edmond Becquerel. When doing experiments involving wet cells, he noted that the voltage of the cell increased when its silver plates were exposed to the sunlight. The photovoltaic effect occurs in solar cells.

How does a photovoltaic system work?

To comprehend the intricate choreography of the photovoltaic effect, one must first grasp the fundamental concepts of solar radiation and semiconductor physics. Solar radiation, the radiant energy emitted by the sun, serves as the primary source of energy for PV systems.

How does a home PV system work?

Most home PV systems have a storage component where the current generated is used to charge connected solar batteries. This is done using a charger that receives current from the panels and charges the batteries, much like you would charge the battery in your phone or laptop.
