You can charge your battery at night to take advantage of cheap electricity rates, and then use the stored electricity during the day to avoid high daytime rates. New applications for storage are developing fast. For example, a few solutions now allow you to share your energy with a wider community and even help stabilize the grid.

What is solar battery storage?

Solar battery storage captures your surplus solar electricity that would otherwise be lost to the grid. It allows you to use this stored solar electricity when the sun isn't shining or at night. A battery can store cheap off-peak electricity and discharge it when prices are high.

Can you use solar energy at night?

However, what you can do is store the energy you generate during the day on a battery pack so that you still have power even when there's little to no sunlight. Whilst solar panels are not effective at generating energy at night, new technology means it's easier than ever to store and use solar energy at night that was produced during the day.

When is the best time to charge a battery storage system?

The off-peak night rate tends to be between 11 pm and 8 am and may be split into chunks of time. If you have an Economy 7 meter and tariff, you will need to look at your bill or contact your supplier directly to find out the best time to charge your home battery storage system.
