

How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

Based on the power generated and the system's demand, the PV and the battery storage systems are scheduled to supply energy to the load, and the battery can capture the surplus energy requirement.
