1 INTRODUCTION. Buildings contribute to 32% of the total global final energy consumption and 19% of all global greenhouse gas (GHG) emissions. 1 Most of this energy use and GHG emissions are related to the operation of heating and cooling systems, 2 which play a vital role in buildings as they maintain a satisfactory indoor climate for the occupants. One way ...

storage method to improve the ability of solar energy to meet a full day's electric demand. This system relies on the high proportion of electrical use resulting from air conditioning demand. As a result, this is not an ideal system for users who do not have a large air conditioning demand, although a similar thermal storage design could

Illustration of an ice storage air conditioning unit in production. Ice storage air conditioning is the process of using ice for thermal energy storage. The process can reduce energy used for cooling during times of peak electrical demand. [1] Alternative power sources such as solar can also use the technology to store energy for
