How should a generator room be ventilated?

C.5 Enough opening / shutters should be provided to the D.G. room so that entry and placement of D.G. set is possible easily. Ventilation of the generator room is necessary to remove heat and fumes dissipated by the engine, alternator and its accessories and to provide clean and fresh combustion air.

Do engine room fans work?

Fans are most effective when they withdraw ventilation air from the engine room and exhaust the hot air to the atmosphere. However, ideal engine room ventilation systems will utilize both supply and exhaust fans. This will allow the system designer the maximum amount of control over ventilation air distribution.

Do Hood fans need to be vented outside?

Building codes require Makeup air for any hood system exhausting over 400 cfm. When cutting or drilling into wall or ceiling, do not damage electrical wiring and other hidden utilities. Duct fans must always be vented to the outdoors. CAUTION: For general ventilating use only. Do not use to exhaust hazardous or explosive materials and vapors.

How do I choose the best engine room ventilation system?

However, ideal engine room ventilation systems will utilize both supply and exhaust fans. This will allow the system designer the maximum amount of control over ventilation air distribution. The fan motors should be mounted outside the direct flow of hot ventilating air for longest motor life.

How many fans should a gen set have?

In these cases, it is better to specify a number of smaller fans than one large fan to supply ventilation air. This also allows you to adjust ventilation if the gen set operates at a lower output. Movable louvers positioned to redirect engine heat back into the room until the jacket water temperatures reach 190 F (88 C) may be used.

How is natural draft ventilation blocked in an engine room?

Natural draft ventilation is almost completely blocked by roofs, SCR house, tool room, and vertical discharge radiators. Warm weather operation may result in unacceptable engine and generator temperatures. Figure 18 shows an engine room designed to provide a combination of ventilation and engine/generator air inlet ducting.
