

# Generator installation specifications for air inlet and exhaust shafts

What is the intake system of a diesel generator set?

The intake system of the diesel generator set is equipped with dry air filter and air filter and air resistance indicator, with exhaust gas turbocharger, full intake and guaranteed performance.

What temperature does a generator exhaust system emit?

Generator exhaust systems must also be engineered and properly installed to accommodate thermal expansion. Generator exhaust systems emit exhaust at temperatures anywhere from 500°F up to 1300°F depending on the unit size, manufacturer, and type of fuel burned.

Who designs and installs a generator exhaust system?

The proper design and functionality of a generator exhaust system falls on the responsibility of the engineering firm of record. If a field fabricated system is being utilized, the design and installation of the system must be a collaboration between the engineering firm and the installing contractor.

How to choose a diesel generator intake pipe?

Diesel intake pipes for diesel generator set should be avoided as far as possible and the number of bends should be reduced, or use a large arc transition. The inner diameter of the intake pipe should not be less than 200mm, and the inner wall of the pipe should be smooth without soldering slag particles.

What temperature should a field fabricated generator exhaust be insulated?

To protect potential personal contact with the system, the outer shell temperature must be below 140°F. These temperature calculations can and should be performed by the UL listed manufacturer based on specific product design criteria. Field-fabricated generator exhaust also requires insulation.

What are the code requirements for generator exhaust?

To investigate code requirements for generator exhaust it is important to start by reviewing the International Mechanical Code (IMC). Section 915 of IMC 2018 regarding Engine and Gas Turbine-Powered Equipment and Appliances is applicable stating: 915.1 General.

o Natural Gas o The proper fuel system installation is critical to obtain proper operation and maintain warranty. refer to section 6 of the Generac Installation Manual o Determine fuel consumption rate in cubic feet per hour at 100%

o Ensure the diesel generator set installed at the proper level as required/approved. o All pipe works are installed and secured in place. o Radiator is clean from dust and free from ...

For fumes or vapors that are lighter than air, exhaust shall be taken from a point within 12 inches (305 mm) of the highest point of the room. 6. The location of both the exhaust and inlet air openings shall be designed to provide air movement across all portions of the floor or room to prevent the accumulation of vapors. 7.

The deep integration of power, heat and other operational aspects, coupled with the use of modular design concepts, have been the keys for success in modern gas turbine packaging. Figure 4 shows an example of a very large gas turbine installation. The air-inlet filter and the exhaust-gas stack are also shown.

When exhaust and intake shafts are located close together, a circulating glycol or heat pump system can be used to transfer heat from exhaust air to intake. The psychrometric chart shows that for every degree of total heat (sensible plus latent) given up by warm saturated exhaust air, the same mass flow of cold intake air can be heated sensibly by 4&#176;C.

The EHT wall air inlet unit consists of an air inlet, a cylindrical tube and a canopy. The air inlet is installed in the upper part of a wall so as to avoid draughts that disturb the occupant and to promote good mixing of the air in the room. A circular hole is drilled on the facade. The air inlet is fixed on a 100 mm wall duct.
