What is a solar PV system?

Solar PV explained PV stands for photovoltaic, meaning energy from light. The origin of the term comes from the Greek words: photo, with 'phos,' meaning light, and 'volt,' which refers to electricity. Solar photovoltaic systems have been around for multiple decades, using the 'photovoltaic effect' to absorb sunlight.

What is a PV panel?

PV cells are electrically connected in a packaged, weather-tight PV panel (sometimes called a module). PV panels vary in size and in the amount of electricity they can produce. Electricity-generating capacity for PV panels increases with the number of cells in the panel or in the surface area of the panel.

Can solar panels be used on a large scale?

The sun provides the most abundant source of energy available. One way to capture this solar energy, is by the use of photovoltaic (PV) systems that convert the energy of the sun directly into electricity. One issue concerning the implementation of solar panels on a large scale, is limited available area.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

How do solar panels work?

It can: In the first approach, solar PV panels on your roof absorb sunlight and convert it into usable electricity for your household. In the second approach, sunlight energy will heat up a substance, which is usually water, that is housed in solar thermal panels.

Can solar panels be made at different voltages?

This way, PV modules can be made at different voltages for different applications. The combination of multiple photovoltaic modules (or panels) is called a photovoltaic system. Solar panels produce direct current (DC) but with a solar inverter, you can convert it to alternate current (AC), which is used for home appliances.

Solar energy is the light and heat that come from the sun. To understand how it's produced, let's start with the smallest form of solar energy: the photon. Photons are waves and particles that are created in the sun's core (the hottest part of the sun) through a process called nuclear fusion. The sun's core is a whopping 27 million degrees ...
