

# How to adjust the height of the front and rear columns of the photovoltaic bracket

How do I adjust the ride height?

To lower the ride height, turn the upper "ride height adjuster" clockwise; to raise the ride height, turn the lower "lock nut" counterclockwise by the amount of adjustment. After turning the adjustment amount, tighten the lower bracket lock nut that was loosened at first step to complete the process.

How do you adjust a lower bracket?

Loosen the "lock nut" on the "lower bracket" by turning it counterclockwise with the hook wrench provided. Once loosened, move the locknut in advance according to the amount of ride height you wish to adjust.

How do you adjust the height of a rebuilt LCV?

This manual is written for this situation. Basically you install the rebuilt LCVs and connect them to the air lines in exactly the same location in the reverse order you removed them . After that you will set the car's height via adjusting the connecting rod's length. This is indeed easier said than done.

How do I adjust caster & camber?

When using adjustable bottom arms, once an adjustment is made you will have to go back to check/re-set caster. Initially use 3° to 4 degrees caster, and 1-degree negative camber (1/2-degree negative camber for 13" wheel/tyre combinations). Finally, set the front tracking as any adjustments to caster or camber will alter the tracking.

Does a negative camber rear bracket raise suspension height?

It shouldn't, but has been known - especially where pattern subframes and some negative camber rear brackets are used. This moves the suspension knuckle socket backwards, which raises the rear suspension height.

What is the minimum size of a RCC column?

Minimum size of an RCC column should not be less than 9" x 12" (225mm x 300mm) with 4 bars of 12 MM Fe415 Steel. These days the minimum I use in my projects is 9" x 12" (225 mm x 300mm) with 6 bars of 12 MM Fe500 steel. You can never go wrong with strong columns.

Adjusting The Height Of Front And Rear. Thread starter mentalward ... Coil over shocks or air shocks will raise the rear but that can cause damage to the under floor bracket and the floor because it removes the weight from the leafs and places the load on the bracket and the floor instead of the leafs . ... is that 1" might be a little too much ...
