Where should a storage container vent be installed?

Vents operate best when installed on opposite sides of a container. This permits the wind to blow fresh, dry air into the unit while allowing hot air to exit through the air vent on the opposite wall, providing natural airflow and temperature reduction. Storage container vents. Storage container ventilation is imperative.

How do you ventilate a used storage container?

Some used storage containers come with small breather vents installed that allow for a little bit of air to pass, but due to being loaded onto ocean going vessels these vents can't be that large because they need to keep water and everything else out. Other options that help to improve ventilation are turbines, fans and ventilating louvers.
