1. Solar Photovoltaic Panels: Solar panels use the photovoltaic effect to convert sunlight into electricity. They collect electrons from the sun's light in the form of direct current (DC) electricity, which is then converted into usable AC electricity through an inverter (more details on this below). What to look out for:

The photovoltaic (PV) power generation system is mainly composed of large-area PV panels, direct current (DC) combiner boxes, DC distribution cabinets, PV inverters, alternating current (AC) distribution cabinets, grid connected transformers, and connecting cables....

Solar inverters are the driving force behind solar energy systems. From small household solar deployments to large-scale farms that help to support the energy grid, every photovoltaic solar energy system requires a way to transform the direct current (DC) energy created by solar panels to alternating current (AC) power. That's the job of the solar inverter.

The project we have undertaken is "Solar Inverter". A solar inverter, or PV inverter, converts the direct current (DC) output of a photovoltaic solar panel into a utility frequency alternating current (AC) that can be fed into a commercial electrical grid or used by a local, off-line electrical network.
