Hybrid supercapacitors combine battery-like and capacitor-like electrodes in a single cell, integrating both faradaic and non-faradaic energy storage mechanisms to achieve enhanced energy and power densities [190]. These systems typically employ a polarizable electrode (e.g., carbon) and a non-polarizable electrode (e.g., metal or conductive polymer).

Despite their numerous advantages, the primary limitation of supercapacitors is their relatively lower energy density of 5-20 Wh/kg, which is about 20 to 40 times lower than that of lithium-ion batteries (100-265 Wh/Kg) [6]. Significant research efforts have been directed towards improving the energy density of supercapacitors while maintaining their excellent ...
