

LIBs are also known as "rocking chair" batteries because  $\text{Li}^+$  moves between the electrodes via the electrolyte [10]. Electrolytes considered the "blood" of LIBs, play an important role in many key processes, including solid-electrolyte interphase (SEI) film formation and  $\text{Li}^+$  transportation, and thus enable the normal functioning of LIBs. As a result, formulating a ...

OverviewHistoryDesignFormatsUsesPerformanceLifespanSafetyA lithium-ion or Li-ion battery is a type of rechargeable battery that uses the reversible intercalation of Li ions into electronically conducting solids to store energy.
