Microgrids can power whole communities or single sites like hospitals, bus stations and military bases. Most generate their own power using renewable energy like wind and solar. In power outages when the main electricity grid fails, microgrids can keep going. They can also be used to provide power in remote areas.

Adoption of complex microgrids can involve multiple energy carriers in integrated energy systems, e.g. involving passive design, or electrical, heat, cooling, and other energy service requirements. Integration significantly increases the coupling and interactions between sources and between supply and end-use at various scales (multinational, national, ...
