

Do microgrid protection schemes meet operational requirements?

The microgrid protection scheme must meet the essential conditions for grid-connected and islanded operational modes. This paper presents a comprehensive review and comparative analysis of protection schemes and their implementation challenges for different microgrid architectures with various operational requirements.

Why is microgrid protection important?

However, it has several operational challenges such as power quality, power system instability, reliability, and protection issues. Microgrid protection strategy is a prime issue for the reliable operation of the microgrid. The microgrid protection scheme must meet the essential conditions for grid-connected and islanded operational modes.

How can microgrid protection be coordinated?

Therefore, microgrid protection must be coordinated in both the grid-connected and islanded mode of operation. This could be done by the separate coordination study and settings of grid-connected and islanded mode protections or by providing sources of high fault current also in islanded mode.

How to protect microgrids in both modes?

Protecting microgrids in both modes (grid-connected and islanded) can be achieved by using different communication architectures associated with protections. Using centralized or distributed architectures means that the relay protection settings are modified centrally or locally regarding microgrid operating conditions.

How to design a microgrid protection system?

Some of the major points to address in the design of the protection schemes for microgrids are: (1) DER with high penetration level and islanded operation mode; (2) the protection system must be adequate for configuration changes; and (3) the architecture of the protection system.

Do microgrid protection systems work for different operating conditions?

A major challenge associated with the implementation of microgrids is to design a suitable protection system scheme for different operating conditions. To overcome this challenge, different approaches have been proposed in the literature. The protection systems applied at microgrids must work both in utility grid faults and microgrid faults.
