What is biological photovoltaics (BPV)?

Biological photovoltaics (BPV) is a clean energy-generating technology that uses biological photosynthetic material to capture solar energy and directly produce electrical power. BPV systems are sometimes also described as living solar panels. Take a look at the video for an introduction here.

How do photosynthetic cells produce energy?

Photosynthetic cells produce a flow of electrons that can be pulled away as a 'photocurrent' and used to power an external circuit, just like a solar cell. This energy production occurs within the cells. Certain plants, like succulents found in arid environments, have thick cuticles to keep water and nutrients within their leaves.

Artificial photosynthesis is a system that replicates the natural photosynthesis process, i.e. a process of converting CO₂, solar energy and H₂O into carbohydrates and O₂ imitating natural photosynthesis, artificial photosynthesis can effectively produce electricity and hydrogen (Chen et al., 2016). The photosynthetic reaction is divided into two half-reactions, and ...
