Deployment, investment, technology, grid integration and socio-economic aspects. Reducing carbon dioxide (CO<sub>2</sub>) emissions is at the heart of the world's accelerating shift from climate-damaging fossil fuels towards clean, renewable forms of energy. The steady rise of solar photovoltaic (PV) power generation forms a vital part of this global energy transformation.

This best practice guide is PV System Commissioning or re-Commissioning Guide Supplement to characterize and maximize PV system performance. If a PV system is commissioned using industry standards, then it should produce as much energy as was expected, right? No, PV industry commissioning standards do not call for performance testing.

High-efficiency battery storage is needed for optimum performance and high reliability. To do so, an integrated model was created, including solar photovoltaics systems and battery storage. Energy storage (ES)

is a challenge that must be carefully considered when investigating all energy system technologies.
