Are insulated-gate bipolar transistors a good choice for solar inverter applications?

For solar inverter applications, it is well known that insulated-gate bipolar transistors (IGBTs) offer benefits compared to other types of power devices, like high-current-carrying capability, gate control using voltage instead of current and the ability to match the co-pack diode with the IGBT.

How do IGBTs work in a PV inverter?

During operation inside a PV inverter, IGBTs are subject to AC stress conditions as opposed to DC stress conditions. This typically consists of a 60 Hz on-off cycle, with a Pulse-Width-Modulated (PWM) signal on the order of 10 - 15 kHz superimposed on the lower-frequency cycle.

Can a 600V 60A silicon IGBT be used in residential inverters?

A commercially available 600V, 60A, silicon IGBT found in common residential inverters was evaluated under normal and extreme operating conditions with DC and pulsed biasing schemes.

Can IGBT degradation cause a failure of an inverter?

This IGBT degradation would most likely not cause the failure of an inverter, but could degrade performance. Furthermore, it is highly questionable if a device exhibiting significant instability would operate for the expected lifetime of an inverter (i.e. 5 to 20 years).

Which efficiency is possible for a solar inverter design?

The latest 600-V trench IGBT is optimized for switching at 20 kHz. It can be seen that this IGBT has lower total power dissipation compared to the previous-generation planar IGBT (Fig. 4). We can conclude that the highest efficiency possible for a solar inverter design, a trench-gate

What is a solar inverter?

A solar inverter is a power-electronic circuit that converts DC voltage from a solar array panel to AC voltage that can be used to power AC loads such as home appliances, lighting and power tools. However, getting the most out of such a topology requires careful analysis and the right choice of the high-side and low-side combination of an IGBT.

For PV inverter application, the SiC MOSFET can replace the Si IGBT. On one hand, the power loss can be reduced, such that a high efficiency can be achieved. On the other hand, the weight and volume of passive elements can be reduced because of the improved switching frequency, such that the high power density can be confirmed.

A three-level NPC2 topology is usually the preferred choice for 1000 V photovoltaic (PV) systems. 1500 V PV systems are becoming more popular as they can reduce system costs and improve end-to-end efficiency. Three-level NPC1 / ANPC topologies enable more robust inverter designs more resistant to cosmic radiation.

Uno. ABB / Power One Aurora Solar Inverter LED Indicators: Green Light - The green "Power" LED indicates that the solar inverter is operating correctly. The green light flashes upon start-up, during the grid check routine. If a correct grid voltage is detected and solar radiation is strong enough to start-up the unit, the green light stays on steady.
