

Parameters of photovoltaic panels (PVPs) is necessary for modeling and analysis of solar power systems. The best and the median values of the main 16 parameters among 1300 PVPs were identified. The results obtained help to quickly and visually assess a given PVP (including a new one) in relation to the existing ones.

MB-MPPT algorithms operate thanks to a priori knowledge about the behaviour of the panel, which is represented by a proper model. The adopted approach, which has been discussed in the previous section, is based on a four-parameter model expressed by (); before starting the operation,  $A_0$  -  $A_3$  have to be properly estimated during a preliminary training stage.

Step 1: Note the voltage requirement of the PV array Since we have to connect N-number of modules in series we must know the required voltage from the PV array.
