

What is the Prince lab microgrid?

The PrInCE Lab microgrid is a low-voltage radial distribution network structured as a TN-S system. It encompasses four different generation types along with a Battery Energy Storage System (BESS) and two load banks. Generators can be differentiated on the basis of the primary energy source used into renewable and non-renewable energy sources.

Are microgrids a viable solution for integrating distributed energy resources?

1. Introduction Microgrids offer a viable solution for integrating Distributed Energy Resources (DERs), including in particular variable and unpredictable renewable energy sources, low-voltage and medium-voltage into distribution networks.

What is a dc microgrid?

Therefore, DC microgrids are recently emerging as a possible solution in the case of only few isolated DC devices that need to be connected into ex-novo networks. In this configuration, most of the DER are connected through DC/DC or AC/DC power electronic converters to one or more DC buses with a regulated voltage.

What are the key innovations in Microgrid technology?

Relevant innovations include adjustments to the electrical connections of its internal DERs so as to ensure their integration into a microgrid structure and the development of islanded and interconnected operating procedures allowing flexibility to seamlessly transition from grid-connected to isolated operation and vice-versa.

What is a grid-connected microgrid?

Grid-connected microgrids are largely adopted to support the integration of DG units and, in particular, of renewable energy sources (RES) in distribution networks.

Is a microgrid possible?

The PrInCE Lab microgrid project demonstrated that it is possible to realize a microgrid by adopting components and equipment originally developed for classical distribution network applications. However, the adoption of these components made their integration into a microgrid structure more complex than the expected.

and characterization of new materials and devices for energy conversion, conditioning, and storage, as well as system applications of these technologies.

The lab supports prototyping, testing, and characterizing power electronic circuits and systems for wind, solar, energy storage, microgrid, and power system applications. DERSIL includes a programmable grid simulator, a wind turbine emulator, 20 solar panels each equipped with a microinverter, and programmable electronic loads.
