What is PV panel rainwater harvesting (pvrh)?

Therefore, we have designed a PV panel rainwater harvesting (PVRH) system that integrates the functions of PV power generation and rainwater harvesting, aiming to develop newly available water and clean energy supply for agricultural production to realize a synergic WEF nexus.

How do PV panels work?

On rainy days, the PV panels are used to harvest rainwater. The collected rainwater flows into the water troughs located below PV panels and then to the water ponds through pipe lines for dripping irrigation in dry season. Fig. 2 shows the agricultural WEF superstructure based on the PVRH system.

Can a PV panel rainwater harvesting system be used in semi-arid areas?

It is noteworthy that the use of PV panels has the advantages of large catchment areas, no infiltration and high storage rate, providing an ideal place and medium for rainwater harvesting in semi-arid areas. Based on this, a PV panel rainwater harvesting system has been designed.

What is a photovoltaic (PV) panel?

Simultaneously, photovoltaic (PV) panels convert solar energy to produce electricity. PV uses abundant and clean solar energy, requires low and flexible capital investment, and is suitable at any scale, all of which makes it an important approach for point-of-application (POA) electricity generation.

How much rainwater can be harvested from a PV system?

In this study, the PV panel surface area used for rainwater harvesting is 288 m<sup>2</sup>. It was calculated that around 118 m<sup>3</sup>/year of harvest can be made annually from the current rain harvesting system. Rainwater harvesting potential for all of the current power plant was calculated as 1646 m<sup>3</sup>/year.
