How to design a microgrid protection system?

Some of the major points to address in the design of the protection schemes for microgrids are: (1) DER with high penetration level and islanded operation mode; (2) the protection system must be adequate for configuration changes; and (3) the architecture of the protection system.

How do centralized or distributed architectures affect microgrid protection?

Using centralized or distributed architectures means that the relay protection settings are modified centrally or locally regarding microgrid operating conditions. This chapter aims to provide the key highlights of the available protection schemes used to address microgrid protection issues.

How should a microgrid protection system respond to a fault?

The microgrid protection system must respond to internal and external faults. In the first case, the protection system should isolate the microgrid from the utility grid to protect the microgrid facility. In the second case, the protection system should isolate the smallest part of the microgrid when clears the fault.

How does the expansion of a microgrid affect power system protection?

As a result of the expansion of a microgrid, changes in the distribution network's direction impact coordination and protection. The literature proposes a variety of solutions for power system protection. In conventional protection systems, relays are timed to transmit backup and primary information at different times.
