What is the indoor VCB operating mechanism?

The Indoor VCB operating mechanism consists of a closing spring, an energy storage system, an overcurrent release, and a switching system. It can be divided into two types: manual and electric operation. The manual operating mechanism has the functions of manual energy storage, manual opening, closing, and over-current protection.

What happens when a magnetic switch is closed?

On switch closure the capacitor C_0 , initially charged to a potential $V(0)$, is discharged through the inductor L_0 into capacitor C_1 . As the potential on C_1 rises a point is reached at which the first magnetic switch L_1 will saturate. C_1 then discharges rapidly into capacitor C_2 . This process continues until C_n discharges into the load.

What are electrical energy storage systems (EESS)?

Electrical energy storage systems (EESS) for electrical installations are becoming more prevalent. EESS provide storage of electrical energy so that it can be used later. The approach is not new: EESS in the form of battery-backed uninterruptible power supplies (UPS) have been used for many years. EESS are starting to be used for other purposes.
