

What is a power electronic converter in a microgrid?

Figure 1. Power electronic converters in microgrids. In an AC microgrid, power electronic converters are used to convert DC power (from PV cells, batteries, EVs, etc.) or variable frequency AC power (from wind turbines) into 50/60 Hz AC power so that the power can be fed into the AC bus and supply loads.

What is a PWM controller?

PWM is a common modulation method. The current controllers are performed on the dq frame to achieve independent control of active and reactive power. Also, different control modes, such as grid-feeding, grid-forming, and grid-supporting control, are presented to accommodate different applications.

What is a hybrid ac/dc microgrid?

This shows a hybrid AC/DC microgrid, which consists of an AC microgrid and a DC microgrid interconnected by an interfacing converter. The microgrid works in grid-connected mode when the utility grid is connected to the AC bus and in stand-alone mode when the utility grid is disconnected. Figure 1. Power electronic converters in microgrids.

What types of converters are used in microgrids?

Then, different topologies of the converters used in microgrids are discussed, including DC/DC converters, single-phase DC/AC converters, three-phase three-wire, and four-wire DC/AC converters. The remaining parts of this chapter focus on how to optimally design and control these converters with the emerging wide-bandgap semiconductors.

What is grid-connected mode in a microgrid?

In the grid-connected mode when a microgrid is connected to the utility grid, converters in the microgrid operate in grid-feeding mode to provide active and reactive power from distributed generators to the microgrid [12].
