

Single-phase photovoltaic inverter fault handling

Does a single phase PV inverter have a fault condition?

In addition to the three-phase PV inverter, in Gonzalez et al. (2018), a single-phase PV inverter (3.2 kVA) is investigated under fault condition when operating with grid-connected functionality. During a fault, the voltage at the PCC of the single-phase PV inverter also reaches 0.05 pu, and the test results are summarized in Table 7.

Do small-scale single-phase photovoltaic inverters protect distribution systems?

This paper presents an analysis of the fault current contributions of small-scale single-phase photovoltaic inverters under grid-connected operation and their potential impact on the protection of distribution systems.

How many single-phase PV inverters with 240 V output voltage?

The results obtained by practical experiments with six single-phase PV inverters with 240 V output voltage are described in Keller et al. (2011). Table 9 lists the average value (fault current magnitude and "trip time") of the six tests performed on each PV inverter.

Does PV insertion affect fault current in residential power distribution networks?

The main objective is to investigate the changes caused in the magnitude of the fault current due to the PV insertion in residential power distribution networks. In both, it is stated that the fault current of each PV system can reach a value of 1.2-2.5 times the PV inverter rated current from 4 to 10 cycles.

What is a fault current in a PV inverter?

In these tests, faults are also caused at the PCC of the PV inverter, leading the voltage to reach 0.05 pu. The first 189 cycles fault current ranges from 1 to 1.2 times the pre-fault current (1 pu). By comparing Tables 4 and 6, it can be seen that the PV inverter model investigated in Gonzalez et al. (2018) is in agreement with the generic group.

Is fault contribution associated with nominal power of commercial PV inverters?

Based on the results obtained from commercial PV inverters, it can be concluded that the fault contribution is not associated with their nominal power. However, articles (Varma et al. 2016) and (Kasar & Tapre, 2018) combine these two characteristics, confusing readers.

Nowadays, single phase inverters are extensively being implemented for small scale grid-tied photovoltaic (PV) system. Small size PV inverters are replacing the central inverters. These inverters convert and transfer the power supplied by the single or a string of modules to the grid. Following this trend, various single phase inverters from conventional full bridge (H4) to more ...
