How can solar thermal components reduce the cost of electricity generation?

Advancements in the design of the solar thermal components improve the performance and consequently reduce the cost of electricity generation. This chapter discusses all the available CSP technologies and highlights the various design and operational parameters on which the overall efficiency of the solar power plants depends.

How to compare the different solar thermal power generation systems?

To compare the different solar thermal power generation systems, some key characteristics/parameters are important to analyze the performance of the power generation system. Some of those parameters are discussed as follows: Aperture is the plane of entrance for the solar radiation incident on the concentrator.

How do I design a solar thermal system?

Designing a solar thermal system involves more than just selecting a specific type of technology. The optimum size of a solar thermal system will vary from building to building; hence, the location, the occupancy and the function need to be considered. For retrofit designs, the existing system also needs to be considered. 2. Literature review

What is solar thermal power generation?

Harnessing solar energy for electric power generation is one of the growing technologies which provide a sustainable solution to the severe environmental issues such as climate change, global warming, and pollution. This chapter deals with the solar thermal power generation based on the line and point focussing solar concentrators.

What are the components of a solar thermal system?

System sizing for DHW consumption The four primary components of the solar thermal system include: the solar collectors, the storage tank, the solar loop and the control system. There is a relationship between the hot water consumption and collector area.

The solar multiple is the ratio of the thermal power generated by the solar field at the design point to the thermal power required by the power block under nominal conditions. Recent studies investigated the optimum size of both TES and the solar multiple for different CSP plants, and it is the effect on the LCOE.

Solar thermal power generation design calculation

Solar energy is the world's most abundant source of energy, it has been shown to have significant potential to meet a considerable portion of the world's energy demand [1], [2]. With 1.7 $\times 10^{14}$ kW of the sun's energy received by the earth surface, only 84 min of solar radiation was estimated to give 900 EJ which was equivalent to the world's energy demand for 2009 [1].
