Are evacuated tube solar thermal collectors suitable in unfavourable conditions?

Fig. 1. Evacuated tube solar thermal collector. Suitability in unfavourable condition. The irregularity of solar radiation in different seasons lead to the need for an efficient energy storage medium due to which working remains unaffected for a few hours in absence of sunlight. The TES are of Sensible heat storage type

What is a solar thermal system?

Solar thermal systems use panels or tubes, collectors, to capture thermal energy from the sun which is often used for domestic hot water but also has a range of other applications. There are primarily two types of solar thermal panels available on the UK market: flat-plate collectors and concentrating collectors.

What is a heat pipe evacuated tube solar collector?

Initially, evacuated tube collectors were used where water was flowing through the tubes, but this type of design had very limited efficiency. So to improve the efficiency new types of design were introduced which included heat pipe evacuated tube solar collectors (ETSC) and U-Pipe ETSC.

What is a solar thermal collector?

A solar collector is used to convert solar irradiance into thermal energy. By far, Evacuated tube solar collector is the most extensively used solar thermal collector in the market due to less convective losses. Different types such as (heat pipe, thermosiphon, U-Tube) were used by different researchers.

What is an evacuated tube solar thermal system?

The evacuated tube solar thermal system is one of the most popular solar thermal systems in operation. An evacuated solar system is the most efficient and a common means of solar thermal energy generation with a rate of efficiency of 70 per cent.

Why do solar hot water systems use evacuated tube collectors?

Solar hot water systems that use Evacuated Tube Collectors as their heat source overcome this problem because the solar collector uses individual rounded tubes which are always perpendicular to the sun's rays for most of the day.
