Why are lithium-ion batteries important?

The increasing energy demands of a growing population and the challenges of climate change provide a strong driving force for transportation electrification and smart grid development. As one of the most widely used energy storage devices, lithium-ion batteries play an important role in those fields.

What causes a lithium ion battery to deteriorate?

State of Charge In lithium-ion batteries, battery degradation due to SOC is the result of keeping the battery at a certain charge level for lengthy periods of time, either high or low. This causes the general health of battery to gradually deteriorate.

Does battery degradation affect eV and energy storage system?

Authors have claimed that the degradation mechanism of lithium-ion batteries affected anode, cathode and other battery structures, which are influenced by some external factors such as temperature. However, the effect of battery degradation on EV and energy storage system has not been taken into consideration.

How a lithium ion battery is degraded?

The degradation of lithium-ion battery can be mainly seen in the anode and the cathode. In the anode, the formation of a solid electrolyte interphase (SEI) increases the impedance which degrades the battery capacity.

What is cycling degradation in lithium ion batteries?

Cycling degradation in lithium-ion batteries refers to the progressive deterioration in performance that occurs as the battery undergoes repeated charge and discharge cycles during its operational life. With each cycle, various physical and chemical processes contribute to the gradual degradation of the battery components.
