Energy / generation services. Utility-scale storage refers to technologies connected to the power grid that can store energy and then supply it back to the grid at a more advantageous time - for example, at night, when no solar power is available, or during a weather event that disrupts electricity generation.

In such a system, the major share of energy would be provided by wind and solar energy as they are considered to have the highest potential in Europe [3]. Due to their natural origin the electricity produced from these sources is fluctuating strongly on both short-term (seconds to hours) and long-term scales (months, years) [4], [5]. As production and ...
