Overview History Theory of operation Materials Efficiencies Production, cost and market Durability and lifetime Environmental and health impact Thin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal. Thin-film solar cells are typically a few nanometers (nm) to a few microns (μm) thick-much thinner than the wafers used in conventional crystalline silicon (c-Si) based solar cells, which can be up to 200 μm thick. Thi...

A 3.5 kilowatt peak (kWp) thin-film solar panel system costs about \$3,500, which is around a third of the cost of a traditional solar panel system of the same size. However, this lower cost comes with trade-offs: thin-film panels offer much lower efficiency and a shorter lifespan. To learn more, check out our guide to solar panel costs.
