

Urban rail energy storage system

What are energy storage systems for urban rail?

Energy storage systems for urban rail The fast and outstanding development of both energy storage technologies and power electronics converters has enabled ESSsto become an excellent alternative for reusing regenerated braking energy in urban rail system . ESSs can be installed either on board vehicles or at the track side.

Can urban rail systems save energy?

Energy savings between 3% and 14%have been reported for different urban rail systems analysed in the literature. Since this is a relatively low-cost measure,it could be considered as the first option to increase the amount of energy recovery in urban rail systems. However its application might be limited by service requirements.

Why are urban rail systems important?

1. Introduction Urban rail systems play a key role in the sustainable development of metropolitan areas for many reasons,but mainly because of their relatively low ratio between energy consumption and transport capacity.

What are the advantages of on-board ESS in urban rail?

Schematic of on-board ESSs operation in urban rail. In comparison with wayside storage solutions,on-board ESSs have the advantage of operating with higher efficiencydue to the absence of line losses. Besides,the management of the recovered energy is simpler since the control is independent of traffic conditions.

Which technologies are suitable for energy storage in urban rail applications?

In order to compare and assess the suitability of the above discussed technologies for energy storage in urban rail applications, one of the first criteria to be considered is technical maturity. In this regard, it can be said that lead-acid batteries are the most mature option since they have been used for over 100 years.

Does braking energy reduce energy consumption in urban rail systems?

Given that numerous and frequent stops are a significant characteristic of urban rail,recuperation of braking energy offers a great potentialto reduce energy consumption in urban rail systems.

Abstract: With the rapid development of urban rail transit, installing multiple sets of ground energy storage devices on a line can help reduce train operation energy consumption and solve the ...

Abstract: The electricity consumption of urban rail transit increases year by year with its rapid development. The regenerative braking energy generated by the train can be absorbed and ...

The electricity consumption of urban rail transit increases year by year with its rapid development. The

Urban rail energy storage system

regenerative braking energy generated by the train can be absorbed and reused by the ground energy storage systems, which can effectively reduce the traction energy consumption, so as to achieve the goal of low carbon and energy saving. It is necessary to ...

With the promotion of "double carbon" plan in China, the energy-saving problem of urban rail transit, as a major energy user of the government, has garnered significant attention. In urban rail train operations, the energy storage devices (ESDs) can temporarily store the regenerative energy from braking trains and feed it back to other accelerating trains. However, the ESDs comes ...

Energy management is an important link in the effective functioning of hybrid energy storage systems (HESS) within urban rail trains. This factor significantly impacts the ...

To further improve the simulation calculation ability of urban rail traction systems during the peak operation period and provide an accurate and reliable simulation tool for the subsequent train schedule and energy storage system design, a multi-train circuit model with a bilateral power supply was established in this paper, and a power calculation algorithm based ...

The wayside energy storage system has been widely used in the subway, but it cannot solve the "regeneration failure" problem. Therefore, an implement using onboard energy storage system to replace onboard braking resistor is proposed, which has the potential to eliminate the "regeneration failure" problem. This paper proposes a coordinated energy management ...

Regarding the capacity configuration of urban rail energy storage systems, existing research has primarily focused on optimizing configurations through various optimization algorithms. Huaixin Chen et al. [13] introduced an optimization method combining a simulation platform for urban rail power supply systems and a genetic algorithm.

Applied Energy Symposium and Forum 2018: Low carbon cities and urban energy systems, CUE2018, 5âEUR"7 June 2018, Shanghai, China A Real-time MPC-based Energy Management of Hybrid Energy Storage System in Urban Rail Vehicles Zhidong Jia*, Jiuchun Jiang, Hongtao Lin, Long Cheng National Active Distribution Network Technology Research ...

Urban rail transit can solve the current inconvenient transportation problem for China's large urban population. A compound onboard energy storage system can meet vehicles" traction ...

With the rapid development of urban rail transit in China, the problems of increasing operating energy consumption and large voltage fluctuations of the traction network have become increasingly prominent. In recent years, energy storage-type regenerative braking energy absorption and utilization devices with the purpose of energy-saving and voltage ...

Many studies and surveys about energy storage systems and multimodal propulsion concepts are found in the

literature. In, the authors review onboard and wayside applications of electrochemical batteries, ...

The planning and construction of urban rail hybrid energy storage system needs to consider a variety of factors, and the objectives such as investment economy, power supply ...

Therefore, the proposed MOGOA is applied to the capacity configuration problem of the urban rail hybrid energy storage systems (with ground batteries and on-board ultracapacitors) of Changsha Metro Line 1 in China, aiming to achieve the minimum voltage fluctuations of DC traction network and the lowest life-cycle cost of HESS simultaneously. ...

In urban rail transit, hybrid energy storage system (HESS) is often designed to achieve "peak shaving and valley filling" and smooth out DC traction network power fluctuation.

There are three major challenges to the broad implementation of energy storage systems (ESSs) in urban rail transit: maximizing the absorption of regenerative braking power, ...

This paper describes a methodology for designing energy storage systems (ESS) for urban railway applications composed of lithium batteries and supercapacitors.

In order to better realize the energy-saving operation of urban rail transit trains, considering the use of regenerative braking energy has become the focus of current academic research.

In recent years, wayside supercapacitor energy storage systems have been increasingly used in urban rail transit. But it has been found in practical applications that the energy storage devices have a slow dynamic response in certain operating conditions. Therefore, this paper analyzes the factors affecting the dynamic response of the energy storage device. In order to improve its ...

Recuperation of braking energy offers great potential for reducing energy consumption in urban rail transit systems. The present paper develops a new control strategy with variable threshold for wayside energy storage systems (ESSs), which uses the supercapacitor as the energy storage device. First, the paper analyzes the braking curve of the train and the V-I ...

Considering that connecting the energy storage system to electrified railway can effectively reduce energy consumption and improve system stability, a comprehensive review on energy storage system of electrified railway is performed. ... Research on regenerative braking energy scheduling of urban rail transit based on bypass DC circuit. J ...

In urban rail transit, hybrid energy storage system (HESS) is often designed to achieve "peak shaving and valley filling" and smooth out DC traction network power fluctuation. In this paper, a variable gain K iterative learning control (K-ILC) is proposed to balance the DC regulated voltage characteristics and the optimal lifetime of the battery storage system in the ...

In recent years, China's urban rail transportation has developed rapidly. It is in line with the direction of urban railway system development to study the technology of regenerative braking energy recovery and utilization and to add energy storage devices to enhance the utilization of regenerative braking energy.

DOI: 10.19799/J.CNKI.2095-4239.2019.0206 Corpus ID: 226437852; Energy management strategy of hybrid energy storage system for urban rail trains @article{Zhang2020EnergyMS, title={Energy management strategy of hybrid energy storage system for urban rail trains}, author={Baoge Zhang and Ping Li and Zhen Zhang and Wang Yu and Yao Rong}, ...

This paper presents a comprehensive overview of the currently available strategies and technologies for recovery and management of braking energy in urban rail, ...
